Consulting Services for phpMyAdmin

Report - January 2021

Overview

Over the month of January 2021 I worked everyday to catch up on the first week that was low on work hours. I handled issues and pull-requests and made some code/performance improvements. Did a lot of bug fixes and testing, also some GitHub actions migrations.

I would say that everything seems more in control now, issues are getting fixed and PRs merged.

First week (week number 01)

This week was the final rush to make phpMyAdmin 5.0 land into Debian. That was most of my work, I had things to do IRL.

Second week (week number 02)

I started handling issues and pull-requests I had in my inbox, and made some Ubuntu PPA uploads. On the `twig-i18n-extension` repository I did setup phpstan and migrate to GitHub actions.

Third week (week number 03)

I finished my work on removing the Apache-2.0 files that where in our GPL-2.0 codebase. Also migrated the main repository to GitHub actions and worked on a re-work of our version handling. On the translation side I manually processed a lot of translations that where blocked because of code changes. I sent the CVE-2021-21252 fix into Debian. And updated some PRs and tested some other ones. Now we have a JS test suite using Jest ! Also worked on some bug fixes and found out some slowness in our code using xhprof.

Fourth week (week number 04)

More tracking down the slowness users had reported and made the JS console async. Fixed some bugs, did some PR and issue management. Completely re-worked the docker repository test suite and removed TravisCI also there. Wrote tests and re-based some contributor PRs and tested them. In the background I upload a fix to our Ubuntu PPA.
